Subject: Statement on the use of artificial intelligence tools in Workshop 02, "Dominó Caos"

1. Tools used.

We used Gemini to correct some composables and Claude to build the game engine

2. Parts developed with the support of artificial intelligence.

We used the tool in four parts of the project. The first is the domain layer, which contains the game rules: GameEngine, DominoRules, Scoring, TurnOptions, and ConfigRules. The second is the data layer, which connects the application to Firebase: GameRepository and StateSerializer. The third consists of reusable UI components, located in the view/components folder: CardView, BoardView, PlayerInfo, PowerPanel, Controls, and Style. The fourth consists of unit tests—that is, the five files in the src/test folder, totaling 52 tests.

3. How it was used. It was used to verify those validations in the GameEngine so that a game could start; we created some, but Claude verified that they didn't cover everything and implemented others so that the engine would work properly. The domino tiles are not images; they are drawn using a canvas. The AI built the template for those canvases to display the drawn tile. The reusable Composables were very incomplete, and the AI indicated what needed to be modified. PartidaRepositorio had issues synchronizing with the room, and Gemini resolved the problem. The tests for EstadoSerializar and MotorPartida were developed entirely by the AI. The AI corrected some minor syntax errors in the view model.

4. Tasks completed directly by the group. We implemented the MVVM architecture ourselves; we organized the files; we built the model and the view models (though they contained errors); and

we developed the main home and registration screens, as well as the game screen, on our own, along with the synchronization with Firebase.

5. Verification and accountability. The group reviewed the generated code, ran it, verified its functionality, and executed the unit tests.
